LETTER TO THE OFFICIAL DRAFTSMAN

**RECEIVED**

COMMISSIONER FOR PATENTS  
ALEXANDRIA, VIRGINIA 22313

MAY 29 2003

Technology Center 2100

SIR:

Any drawing corrections required by the Chief Draftsman or drawing amendments approved by the Examiner have been incorporated into the copies of the Formal Drawings submitted herewith. It is requested that the enclosed 42 sheets of Formal Drawings be entered to replace the drawings previously filed in this application.

Respectfully submitted,

OBLON, SPIVAK, McCLELLAND,  
MAIER & NEUSTADT, P.C.

RETURN VALUE	FUNCTION NAME	DESCRIPTION
bool	getNextSession	RETURNS FALSE WHEN THERE IS NO MORE SESSION; TRUE OTHERWISE
string	getFileName	RETURNS FILE NAME FOR THE EventData
map<string, string>	getSessionInformation	RETURNS THE MAP. KEYS ARE UserID, Application ID, CumulativeSessionNumber, StartTime, and Duration
map<string, vector<string>>	getSessionEventData	RETURNS THE MAP. KEYS ARE EventName and EventTiming. THE VALUES OF EventTiming VECTOR ARE IN THE UNIT OF 10th OF A SECOND CONVERTED FROM UNSIGNED INTEGER TO STRING

*FIG. 12B*

RETURN VALUE	FUNCTION NAME	DESCRIPTION
bool	getNextLine	RETURNS ONE LINE OF STRING DATA AS AN OUT PARAMETER STRING. THE FUNCTION RETURNS TRUE IF THERE IS A LINE; FALSE IF NO MORE LINE EXISTS WITH EMPTY STRING
string	getFileNameWithSuffix	RETURNS FILE NAME FOR THE DATA WITH SUFFIX IF APPLICABLE

SHEET 18 OF 42

```
// 5. calls the function formatEventData() of
// CAbsDataFormatter. CMonitorManager passes the
// usage information, CAbsEventData, into this
// function. This function returns the formatted
// usage information, CAbsFormattedEventData, to
// CMonitorManager.

CAbsFormattedEventData * loc_pAbsFormattedEventData =
loc_pAbsDataFormatter->formatEventData(loc_pAbsEventData);

// 6. calls the function createProtocolProcessor() of
// CProcessorBuilder. CMonitorManager passes an int
// for the communication protocol into this function.
// The int is the first int from the protocol vector,
// list<int>. This function returns the protocol
// processor, CAbsProtocolProcessor, to CMonitorManager.

for(list<int>::iterator loc_ProtocolVectorIterator =
loc_ProtocolVector.begin(); loc_ProtocolVectorIterator NE
loc_ProtocolVector.end(); loc_ProtocolVectorIterator ++) {
CAbsProtocolProcessor * loc_pAbsProtocolProcessor =
loc_ProcessorBuilder.createProtocolProcessor(
* loc_ProtocolVectorIterator);

// 7. calls the function processFormattedData() of
// CAbsProtocolProcessor. CMonitorManager passes the
// formatted usage information, CAbsFormattedEventData,
// into this function. This function returns a bool to
// CMonitorManager to indicate if the usage information
// was communicated using the protocol.

loc_pAbsProtocolProcessor->processFormattedData(
loc_pAbsFormattedEventData);
}

// 8. steps 6 and 7 are repeated for each protocol,
// int, in the protocol vector, list<int>.
)

// 9. steps 3 through 8 are repeated for each format
// until the function getFormatAndProtocolVector()
// returns NO to CMonitorManager.

)

### 3.3 CProcessorBuilder Class Specification

#### 3.3.1 Function List

public:

```
CProcessorBuilder();  
~CProcessorBuilder();  
CAbsDataFormatter*createDataFormatProcessor(int in_nFormat);  
CAbsProtocolProcessor*createProtocolProcessor(int in_nProtocol);
```

private:

```
void initDataFormatProcessorMap();  
void initProtocolProcessorMap();
```

Include the following functions to create the different data format processors and protocol processors

```
CAbsDataFormatter*createCommaDataFormatter();  
CAbsDataFormatter*createXMLDataFormatter();  
CAbsProtocolProcessor*createSmtpProtocolProcessor();  
CAbsProtocolProcessor*createFtpProtocolProcessor();
```

If new data formats or new protocols are added, then new functions to create them must be added.

Include the following typedef declarations for the functions that create the data format processors and protocol processors.

```
typedef CAbsDataFormatter*(*DataFormatProcessorBuilder)();  
typedef CAbsProtocolProcessor*(*ProtocolProcessorBuilder)();
```

### 3.3.2 Class Attributes

Type	Attribute Name	Description
CAbsDataFormatter*	m_pDataFormatter	This attribute member points to the data format processor object. It is initialize to 0 in the constructor and the data format processor object is created by the function createDataFormatProcessor(). This function may be called multiple times so that it must delete the previous data format processor object pointed to by this attribute member before creating a new one. The destructor will delete the last data format processor object pointed to by this attribute member.
map<int, DataFormatProcessor Builder>		This attribute member is a map of pointers to functions that create the data format processor. The key to this map is an int for the data format type. The value is a pointer to a function that creates the data format processor corresponding to the key. The pointers to the functions in the map are initialized in the function initDataFormatProcessorMap().

SHEET 22 OF 42

Continued from Fig.18B

	<p>This attribute member is a map of pointers to protocol processor objects and pointers to functions that create them. The key to this map is an int for the protocol processor type. The value is a pair consisting of a pointer to the protocol processor object and a pointer to a function that creates the protocol processor object. All the pointers to the protocol processor object are initialized to 0 and its corresponding functions are initialized by the function initProtocolProcessorMap(). The protocol processor objects are created by the function createProtocolProcessor(). The destructor will delete all the protocol processor objects pointed to by the map.</p>

## CFormatProtocol\_InformationBase Class Specification

Author: Tetsuro Motoyama

### 5.2 CFormatProtocol\_InformationBase Class Specification

#### 5.2.1 Function List

```
public:
    CFormatProtocol_InformationBase();
    ~CFormatProtocol_InformationBase();
    void storeFormatAndProtocol( int in_nFormat, int in_nProtocol );
    bool getFormatAndProtocolVector( int & out_nFormat, list<int> & out_ProtocolVector );
private:
    void setDefaultFormatAndProtocol();
```

#### 5.2.2 Class Attributes

Type	Attribute Name	Description
map<int, list<int>>	m_FormatProtocolVectorMap	The key is a format value, and the list is the list of protocol values associated to the key. Because subscripting [] is not needed in this implementation, list is used for the vector implementation. This map is used to return the necessary information for getFormatAndProtocol Vector function Note: >> is >space> to distinguish from'>>' that is used by iostream.
map<int, list<int>>	m_ProtocolFormatVectorMap	The key is a protocol value, and the list is the list of format values associated to the key. Because subscripting [] is not needed in this implementation, list is used for the vector implementation. This map is used to modify the map above if the protocol can take only one format.

Continued to FIG. 23B

**FIG. 23A**

Continued From FIG. 23A

bool	m_bFirstGetCall	This flag is used to call the function in CProtocolRestrictionCheck. The constructor set this to be true. The function, getFormatAndProtocol Vector, sets it to be false
map<int, list<int>>:: iterator	m_FormatProtocolVector MapIterator	interator used to iterate the map.
CFormatProtocol CombinationCheck	m_FormatProtocol CombinationCheck	This object is to check the combination of format and protocol
CProtocolRestriction Check	m_ProtocolRestriction Check	This object is to check the protocol restriction. Currently, the only restriction is if protocol can have only one format support.

### 5.2.3 Function Definitions

```
/////////////
// Function:      CFormatProtocol_InformationBase
// Description:   Constructor
// Preconditions: None
// Postconditions: None

## CFormatProtocolCombinationCheck Class Specification

Author: Tetsuro Motoyama

### 5. 3 CFormatProtocolCombinationCheck Class Specification

#### 5. 3. 1 Function List

public:

```
CFormatProtocolCombinationCheck();
~CFormatProtocolCombinationCheck()
bool isFormatProtocolCombinationOK(const int in_nFormat, const int in_nProtocol);
```

private:

```
void initMatrix();
```

#### 5. 3. 2 Class Attributes

Type	Attribute Name	Description
map<int, set<int>>	m_CombinationMatrix	Key is the format. The set contains the protocols that are valid for the particular format

#### 5. 3. Function Definitions

```
///////////////////////////////
// Function:      CFormatProtocolCombinationCheck
// Description:   Constructor
// Preconditions: None
// Postconditions: None
// Algorithm:    call initMatrix
/////////////////////////////
```

```
///////////////////////////////
// Function:      ~CFormatProtocolCombinationCheck
// Description:   Destructor
// Preconditions: None
// Postconditions: None
// Algorithm:    Default
/////////////////////////////
```

```
//////////  
// Function:      isFormatProtocolCombinationOK  
// Description:   Check the passed format and protocol values  
//                  to be valid or not. If valid, return yes  
//                  no otherwise  
// Preconditions: None  
// Postconditions: None  
// Algorithm:     1. Use find function of the Matrix for  
//                  in_nFormat  
//                  2. If returned iterator is end, return No  
//                  3. get the set value for the key format  
//                  4. Use the find function of the set for  
//                  in_nProtocol  
//                  5. if returned iterator is end, return no  
//                  6. return yes  
//////////  
  
//////////  
// Private Function: initMatrix  
// Description:    This function initializes m_CombinationMatrix.  
//                  If new formats or protocols are added, this  
//                  function must be modified.  
// Preconditions: None  
// Postconditions: None  
// Algorithm:      1. Create the local set<int>  
//                  2. for each format  
//                      2.1 fill in the local set  
//                          with the protocol numbers  
//                          that are valid for the format,  
//                          using insert function  
//                      2.2 m_CombinationMatrix [format]  
//                          = local set  
//                      2.3 clear local set  
//////////
```

## CProtocolRestrictionCheck Class Specification

Author: Tetsuro Motoyama

### 5.4 CFormatProtocolRestrictionCheck Class Specification

#### 5.4.1 Function List

```
public:  
    CFormatProtocolRestrictionCheck();  
    ~CFormatProtocolRestrictionCheck()  
    void getFormatProtocolVectorMapAfterCheckingProtocolRestriction  
        (map<int, list<int>> & inOut_Map, const map<int, list<int>> & in_Map);  
  
private:  
    void initOneFormatRestriction();  
    void oneFormatRestriction()  
        (map<int, list<int>> & inOut_Map, const map<int, list<int>> & in_Map);
```

#### 5.4.2 Class Attributes

Type	Attribute Name	Description
vector<bool>	m_bOneFormatRestriction	Array size should be protocol size+1. The position corresponds to the protocol.

#### 5.4.3. Function Definitions

```
//////////  
// Function:      CProtocolRestrictionCheck  
// Description:   Constructor  
// Preconditions: None  
// Postconditions: None  
// Algorithm:    call initOneFormatRestriction  
//////////
```

```
//////////  
// Function:      ~CFormatProtocolRestrictionCheck  
// Description:   Destructor  
// Preconditions: None  
// Postconditions: None  
// Algorithm:    Default  
//////////

SHEET 38 OF 42

```
//////////  
// Function: getFormatProtocolVectorMapAfterCheckingProtocolRestriction  
// Description: Check the restriction on the protocol.  
//  
// Currently, there is only one possible restriction  
// defined in the requirements. If there are more  
// restrictions, more private functions should be  
// added and called.  
// Preconditions: None  
// Postconditions: None  
// Algorithm: 1. Call oneFormatRestriction function  
//////////
```

```
//////////  
// Private Function: initOneFormatRestriction  
// Description: This function initialize the attribute  
// m_bOneFormatRestriction. If more protocols are  
// added, this initialization must be modified.  
// Preconditions: None  
// Postconditions: None  
// Algorithm: 1. use assign(size+1, false) to initialzie the  
// vector to false.  
// 2. set the entries of true.  
// Note: for class debug version, use  
// ifdef and  
// bool & pos1 = m_bOneFormatRestriction [1];  
// bool & pos2 = m_bOneFormatRestriction [2];  
// and so on to be able to see and to  
// change the value.  
//////////
```
